

Recirculating (Wastewater Reuse) Water Production System 1000L/Day

Water produced by the system is purified and filtered for reuse. This allows for the reuse of initially produced water, only requiring additional production to replace what is consumed or lost through evaporation and dissipation, thereby **reducing electricity costs.**

※For drinking water, it is legally and perceptually preferable to store it in a separate tank.

water purifier more than 4,000 L per day

Handwashing

Showers

Toilets

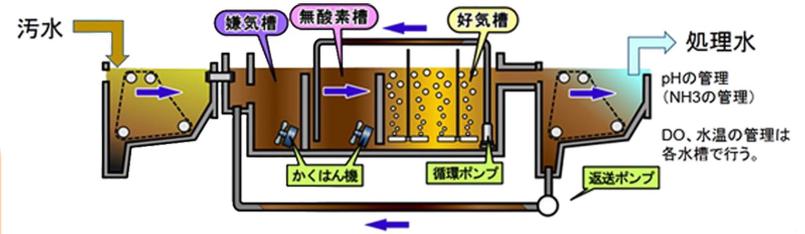

Facilities for water use include above examples

Water Storage Tank

Filtration

Microbial Filtration Septic Tank

Advanced ozone water treatment

※The system can also be applied to smaller water production capacities such as 200L.
